

# Research Presentation

# Introduction

# Important Terms

- First let us understand few terms:
  - Dynamic Document
  - Reproducible Research
  - Markdown
  - Literate Programming

# Dynamic Documents

- A living document or dynamic document is a document that is continually edited and updated.
- Unlike static documents dynamic documents can get easily updated

# Reproducible Research

- It is the research intended to facilitate the replication of scientific findings by including data and software code
- This allows readers to verify the findings for themselves

# Markdown

- Markdown is a lightweight mark-up language with plain text formatting syntax designed
- It can be converted to HTML and many other formats using a tool by the same name
- Markdown is often used
  - to format readme files,
  - for writing messages in online discussion forums,
  - to create rich text using a plain text editor.

# Literate Programming

- Literate programming is an approach to programming introduced by Donald Knuth in which a program is given as an explanation of the program logic in a natural language, such as English
- Literate Programming has following properties:
  - Article being a mix of text and code
  - Analysis code divided into text and code
  - Presentation code formats the results (tables, graphs etc.)

text using Markdown syntax	the corresponding HTML produced by a Markdown processor	the text viewed in a browser

I spend so much time on [Twitter][1] and [Facebook][2] [1]: <a href="http://www.twitter.com">http://www.twitter.com</a> "Twitter" [2]: <a href="http://www.facebook.com">http://www.facebook.com</a> "Facebook"	I spend so much time on <a href="http://www.twitter.com">Twitter</a> and <a href="http://www.facebook.com">Facebook</a>
Newlines require a double space after the end of the line	

# R Markdown

# What is R Markdown?

- R Markdown is an authoring format that enables easy creation of ***dynamic documents***, presentations, and reports from R
- It combines the core syntax of markdown with embedded R code chunks
- We can easily edit the markdown documents in RStudio

# Package rmarkdown

- Markdown functionality is provided by package *rmarkdown* which needs to be installed
- Markdown can be converted to HTML document with the help of package *rmarkdown*

# Package knitr

- *knitr* is a package that enables integration of R code into LaTeX, LyX, HTML, Markdown, AsciiDoc, and reStructuredText documents
- The purpose of *knitr* is to allow reproducible research in R through the means of **Literate Programming**.

# Package *xtable*

- Package *xtable* includes function *xtable()* which attractively formats data frames and matrices for inclusion in reports
- *xtable()* can also format objects produced by *lm()*, *glm()*, *aov()*, *table()*, *ts()* etc.

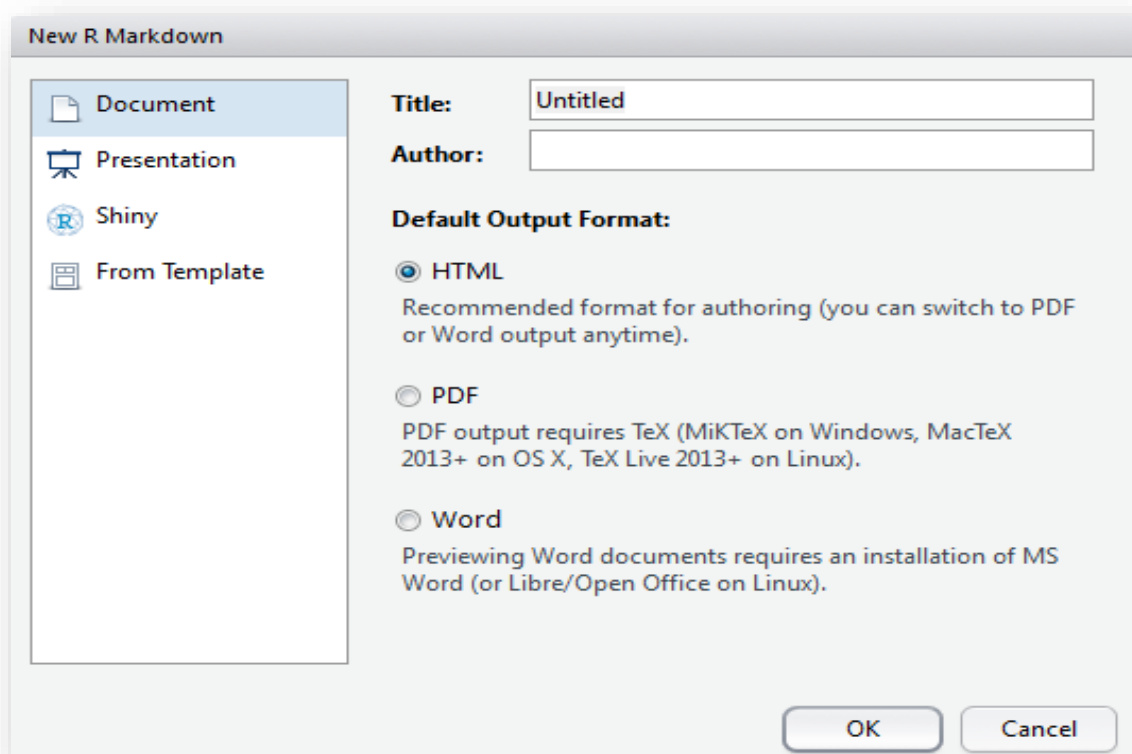

# Creating R Markdown Document

- To incorporate R output details in a document, create a text document which contains:
  - Report text
  - Markdown syntax
  - R code chunks (R code surrounded by delimiters)
- The text file for R Markdown is saved with extension `.Rmd`

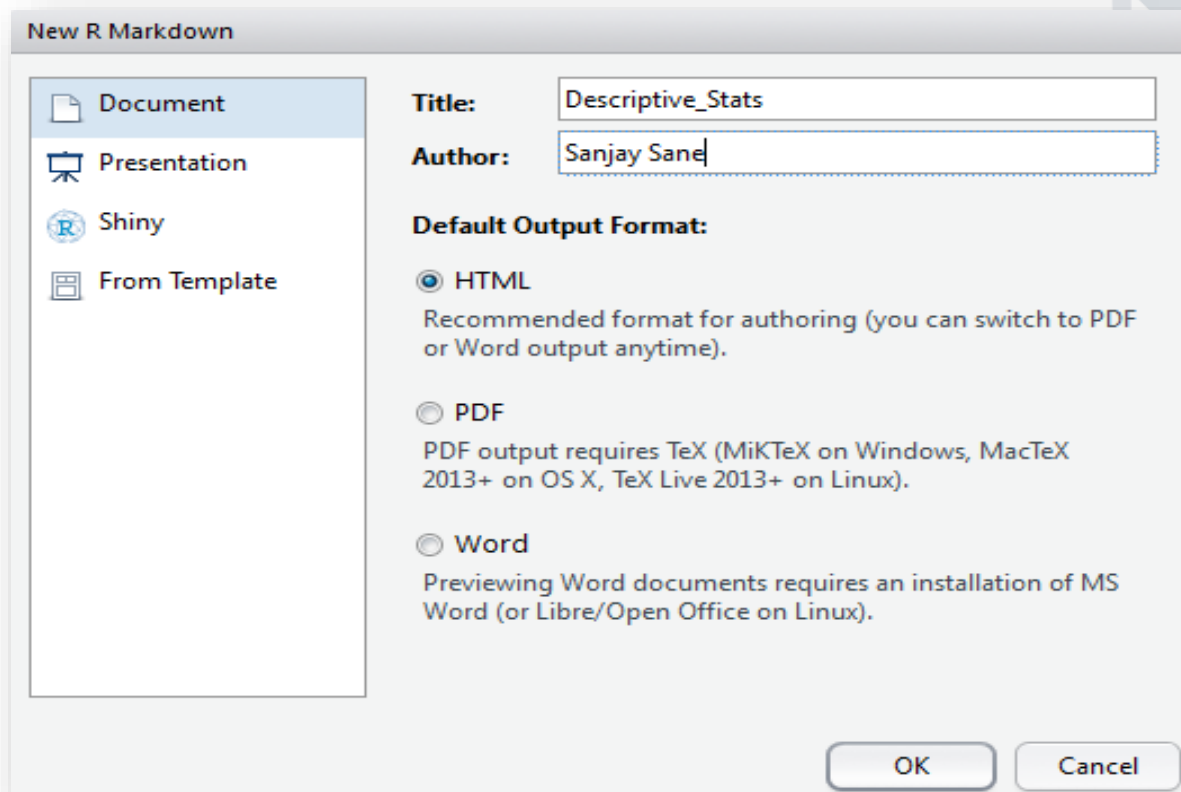

# Using R Studio for Markdown

- Choose File > New File > R Markdown from the R Studio Menu
- You will see the following dialog box:

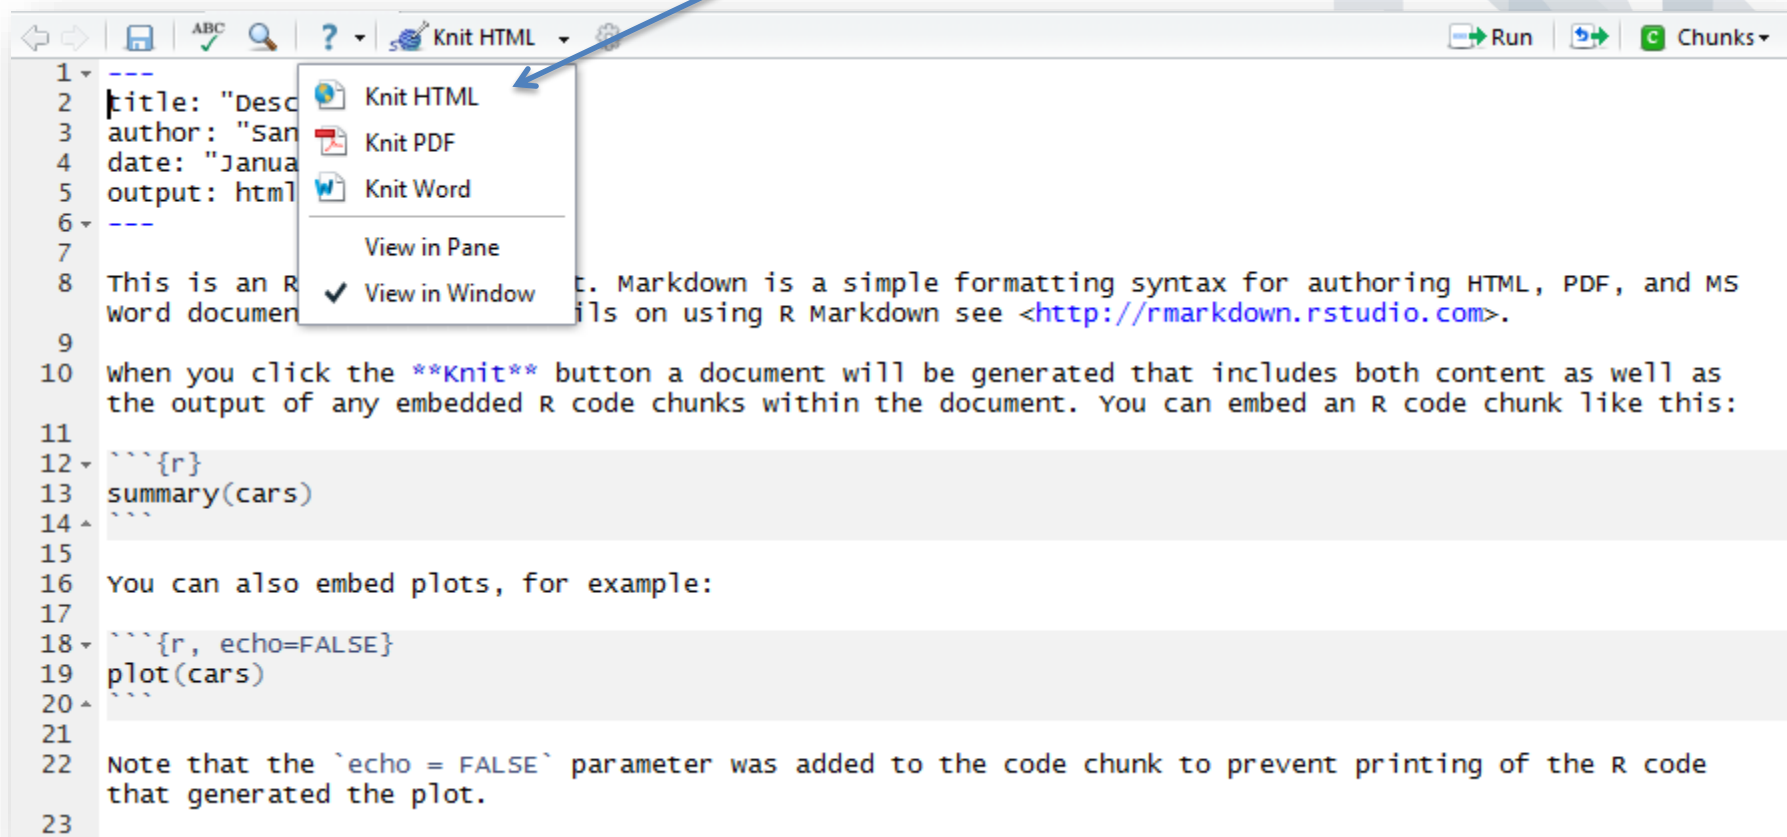

# Using R Studio for Markdown

- Choose the type of the report you want to generate and R Studio will create an outline of the file for you.

# Using R Studio for Markdown

- You can choose the rendering option from the Knit dropdown list as shown:

## R Markdown Example: Desc\_Stats\_Grp.Rmd

### R Markdown Code:

```
###Descriptive Measures
```

```
####Mean
```

The function used is `mean()`. It is also necessary to specify whether there are NA values in the input variable with the option `*na.rm=TRUE*`. By default `**na.rm**` is FALSE which will give NA as the output even if the input variable contains just one NA value

```
```{r}
Sales <- c(23000,50000,20000,NA,34000,78000,83000)
mean(Sales) # Not recommended

mean(Sales,na.rm = TRUE) # Recommended
```
```

### R Markdown Output:

#### Descriptive Measures

##### Mean

The function used is `mean()`. It is also necessary to specify whether there are NA values in the input variable with the option `na.rm=TRUE`. By default `na.rm` is FALSE which will give NA as the output even if the input variable contains just one NA value

```
Sales <- c(23000,50000,20000,NA,34000,78000,83000)
mean(Sales) # Not recommended
```

```
## [1] NA
```

```
mean(Sales,na.rm = TRUE) # Recommended
```

```
## [1] 48000
```

# R Markdown Example:

R Markdown Code: Desc Stats Grp Rmd

```
####Histogram
Histogram is the graph which gives us the distribution of numerical data.
```{r, echo=FALSE, fig.width=5, fig.height=4}
hist(cars$dist)
```
```

echo = FALSE parameter was added to the code chunk to prevent printing of the R code that generated the plot. fig.width and fig.height indicate dimensions of output

R Markdown Output:

## Histogram

Histogram is the graph which gives us the distribution of numerical data.

### Histogram of cars\$dist

# Example:

## R Markdown Code:

```
Regression output of Insurance data with `r n` records is given by:
```{r results='asis'}
library(xtable)
options(xtable.comment=FALSE)
print(xtable(sfit), type="html",html.table.attributes="border=1")
```
It's  $R^2 =$  `r sfit$r.squared`.
```

Function `xtable()` is used to format the table output. Also note the use of R inline code such as ``r n``

## R Markdown Output:

```
library(xtable)
```

```
## Warning: package 'xtable' was built under R version 3.2.3
```

```
options(xtable.comment=FALSE)
print(xtable(sfit), type="html",html.table.attributes="border=1")
```

|             | Estimate    | Std. Error | t value | Pr(> t ) |
|-------------|-------------|------------|---------|----------|
| (Intercept) | -10084.2131 | 3504.1812  | -2.88   | 0.0237   |
| Home        | 167.3267    | 5.8955     | 28.38   | 0.0000   |
| Automobile  | 54.1053     | 3.6559     | 14.80   | 0.0000   |

It's  $R^2 = 0.9967184$ .

## R Markdown Cheat Sheet

learn more at [rmarkdown.rstudio.com](http://rmarkdown.rstudio.com)

rmarkdown 0.2.50 Updated: 8/14

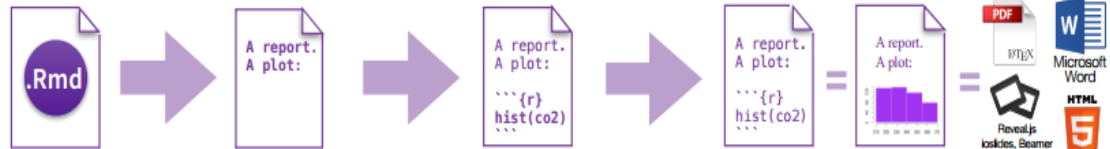

**1. Workflow** R Markdown is a format for writing reproducible, dynamic reports with R. Use it to embed R code and results into slideshows, pdfs, html documents, Word files and more. To make a report:

i. **Open** - Open a file that uses the .Rmd extension.

ii. **Write** - Write content with the easy to use R Markdown syntax

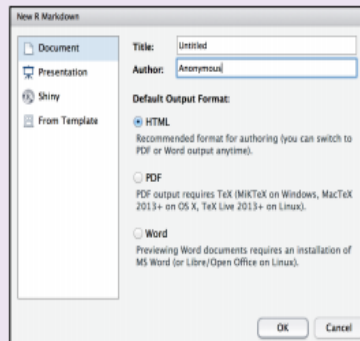

iii. **Embed** - Embed R code that creates output to include in the report

iv. **Render** - Replace R code with its output and transform the report into a slideshow, pdf, html or ms Word file.

**2. Open File** Start by saving a text file with the extension .Rmd, or open an RStudio Rmd template

- In the menu bar, click **File ► New File ► R Markdown...**
- A window will open. Select the class of output you would like to make with your .Rmd file
- Select the specific type of output to make with the radio buttons (you can change this later)
- Click OK

**3. Markdown** Next, write your report in plain text. Use markdown syntax to describe how to format text in the final report.

### syntax

Plain text  
End a line with two spaces to start a new paragraph.  
\*italics\* and *italics*  
\*\*bold\*\* and **bold**  
superscript<sup>2</sup>  
~~strikethrough~~  
[link] ([www.rstudio.com](http://www.rstudio.com))  
  
# Header 1  
## Header 2  
### Header 3  
#### Header 4  
##### Header 5

### becomes

Plain text  
End a line with two spaces to start a new paragraph.  
*italics* and *italics*  
**bold** and **bold**  
superscript<sup>2</sup>  
~~strikethrough~~

Header 4

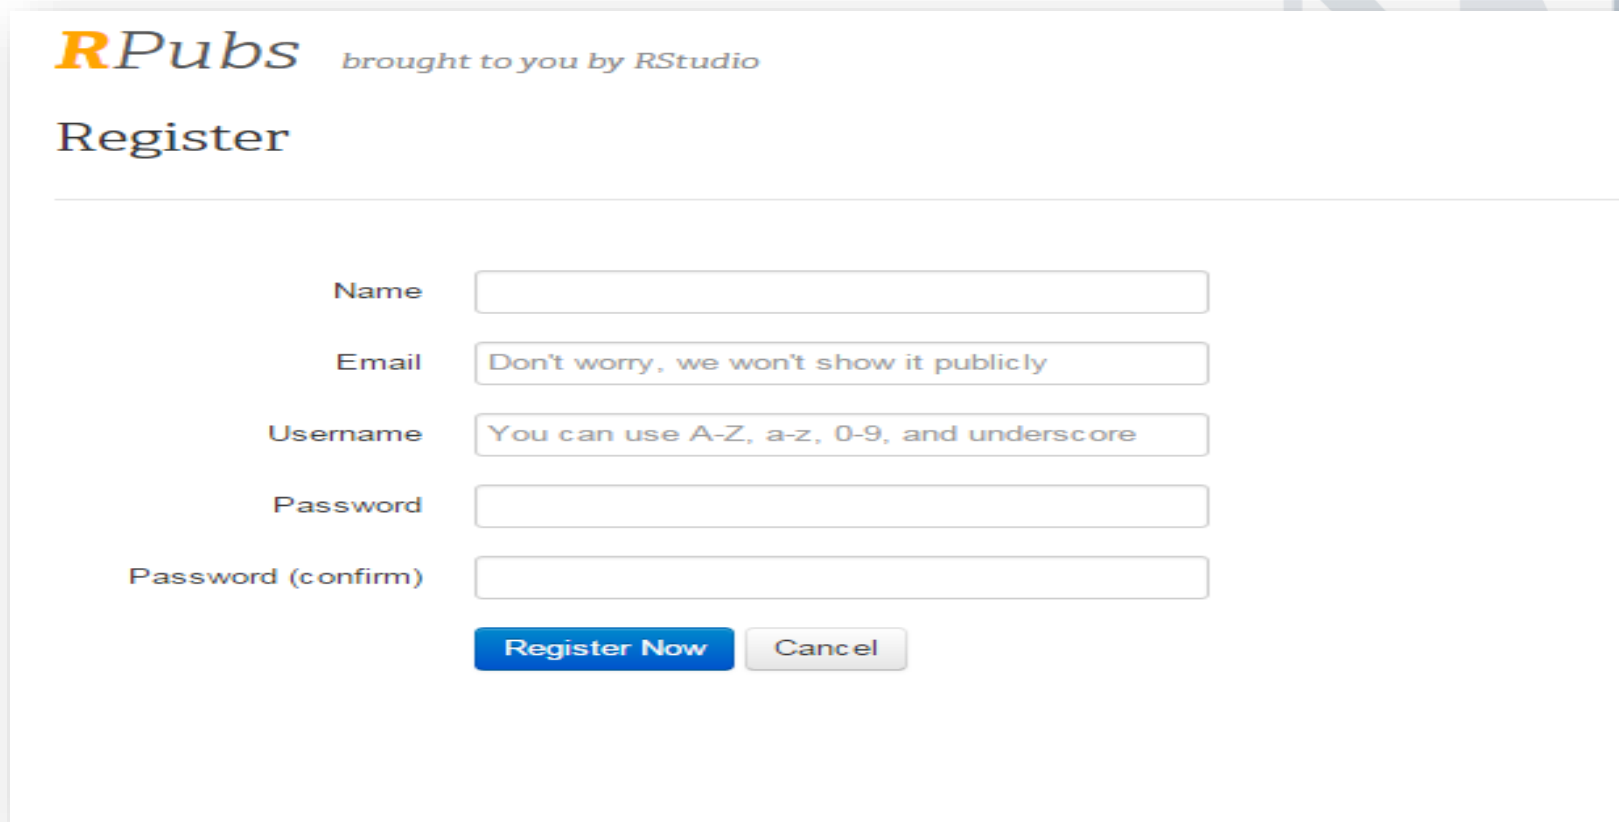

# RPubs

# RPubs

- RPubs is a portal where you can share the R Markdown documents
- For sharing it requires you to be registered user

- # Steps to Publish a Document on RPubS
- Before publishing you need to register yourself on RPubS Website <https://rpubs.com>.

The screenshot shows the RPubS registration interface. At the top, the logo 'RPubS' is displayed in orange and blue, followed by the tagline 'brought to you by RStudio'. Below this, the word 'Register' is centered. The form consists of five input fields: 'Name', 'Email', 'Username', 'Password', and 'Password (confirm)'. Each field has a placeholder text: 'Name' is empty, 'Email' says 'Don't worry, we won't show it publicly', 'Username' says 'You can use A-Z, a-z, 0-9, and underscore', 'Password' is empty, and 'Password (confirm)' is empty. At the bottom of the form, there are two buttons: a blue 'Register Now' button and a grey 'Cancel' button.

**RPubS** brought to you by RStudio

## Register

Name

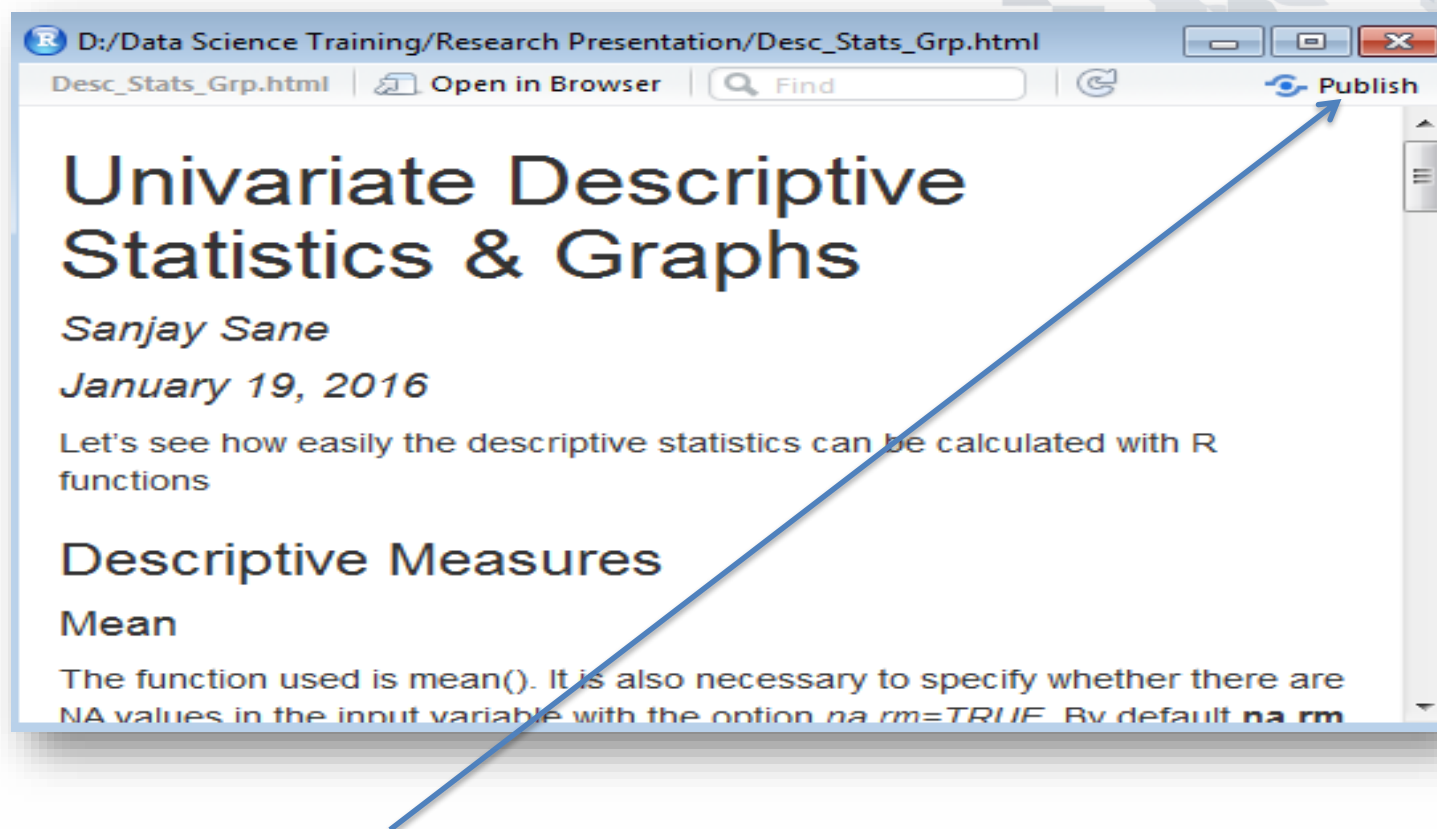

Email

Username

Password

Password (confirm)

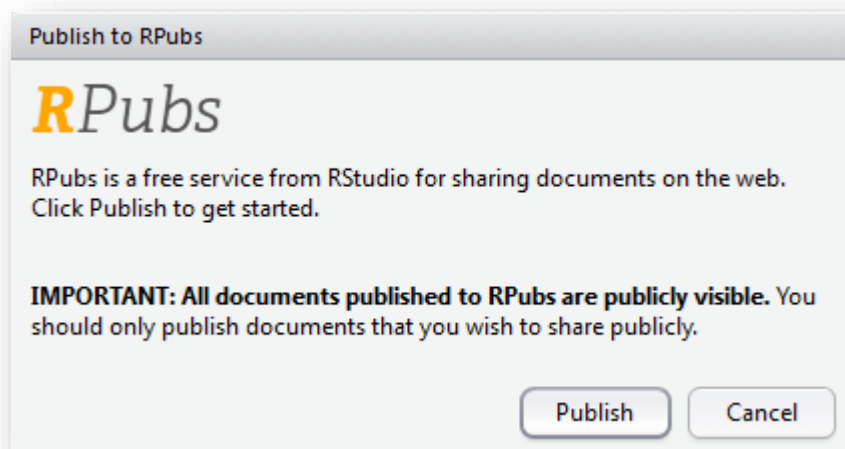

- # Steps to Publish a Document on RPubS
- Open the R Markdown document in output mode as shown

- Click on the *Publish* button on the top right corner

# Steps to Publish a Document on RPubs

- You may be prompted to install some more packages if they aren't installed on your machine. Press Yes button to install them
- After installation of required packages we get the following window:

- Click on the *Publish* button on the dialog box
